Online Supplementary Figure S1. Prevalence of thrombocytosis and thrombocytopenia in Ogliastra villages. Estimates are age- and sex-standardized, by the direct method, to the 2008 resident population of Italy (95% C.I.).
Online Supplementary Figure S2. A representative example of Ogliastra pedigrees with several thrombocytopenic members. Affected relatives are represented in red; red numbers over double straight lines indicate consanguinity and are a measure of the kinship between parents (calculated as the absolute value of base two logarithm of the kinship coefficient); red numbers under double straight lines represent numbers of meiotic steps between consanguineous partners and their common ancestors.
