Version 3

Modifying ADAMTS13 to modulate binding of pathogenic
autoantibodies of patients with acquired thrombotic thrombocytopenic
purpura

Nuno A.G. Graça, Bogac Ercig, Leydi Carolina Velásquez Pereira,
Kadri Kangro, Paul Kaijen, Gerry A.F. Nicolaes, Agnès Veyradier, Paul
Coppo, Karen Vanhoorelbeke, Andres Männik, and Jan Voorberg

Disclosures: This project has received funding from the European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement number 675746 (PROFILE). The authors declare no conflicts of interest.

Contributions: NAGG, BE, PK, AM, GAFN and JV designed the experiments. NAGG performed the experiments. BE provided the computer models. LCVP and KK expressed further ADAMTS13 wild-type and other variants, being critical for the success of the study. KV provided antibodies 3H9, and biotinylated 19H4 and 17G2. AV and PC provided patient materials. NAGG and JV wrote the manuscript. All authors provided critical input in manuscript revision before submission.
