Interpreting fusion-transcript stability as one layer of leukemogenic fitness. Comment on: “Chromosomal rearrangement-enhanced mRNA stability drives the oncogenic potential of fusion genes in pediatric leukemia” by Yuan Liu, Tong Cui and Xuan Wang

Retraction Notice due to paper mill activity of the paper:
Comment with doi https://doi.org/10.3324/haematol.2026.301610
Interpreting fusion-transcript stability as one layer of leukemogenic fitness. Comment on: “Chromosomal rearrangement-enhanced mRNA stability drives the oncogenic potential of fusion genes in pediatric leukemia”

The comment with doi https://doi.org/10.3324/haematol.2026.301610 has been retracted by the Editor-in-Chief of Haematologica. For details on our editorial standards, please refer to the Haematologica policy on the misuse of Artificial Intelligence in submitted manuscripts (https://haematologica.org/our-policies).

This comment was found to be nearly identical to other comments submitted by different authors discussing various original articles in Haematologica. Following an internal investigation, it was determined that this contribution originated from a coordinated network and exhibited clear indicators of systematic manipulation (paper mill activity). The authors were contacted and responded to our request for clarification, but were unable to convincingly explain the anomaly that was observed. Consequently, the Editor concluded that the comment is non-authentic, standardized, and lacks legitimate scientific rationale. The authors have been formally notified of this retraction.
