Supplemental data

Table A. Cooperating Centers of Hematology of the CD34+PB FISH study.

Table B. Possible aberrations detectable by FISH probes used in this study (by Abbott® or MetaSystems®).

Table C. Chromosomal aberrations according to IPSS/-R classification detectable by the FISH probe panel (all Abbott® or MetaSystems® products) performed for this study. n.a.: not applicable; #: unrelated clones not separable.

Figure A. Flow Chart of the CD34+PB FISH Study: The large superpanel was performed at study entry, every 12 months during follow up and in every case of suspected progression of the disease. The smaller standardpanel was performed every 2 months in the first and every 3 months in the second and third year of the diagnostic study, plus, if necessary, an informative probe of the superpanel.

Figure B. Prognosis regarding overall survival (OS) and AML-free survival (AFS) according to therapy regimen in the CD34+PB FISH cohort. BSC: Best supportive care; any other: any other than best supportive care.

Figure C. Overall survival (A) and AML-free survival (B) by CBA and CD34+PB FISH. p not significant for both.

Table A: Cooperating Centers of Hematology of the CD34+PB FISH study.
