Supplementary Methods

Generation of immature dendritic cells

Blood was drawn from healthy HLA class II-typed volunteers after giving informed consent in accordance with Dutch regulations and after approval from the Sanquin Ethical Advisory Board in accordance with the Declaration of Helsinki. Depending on the amount of cells required, peripheral blood mononuclear cells were collected using Ficoll-Paque Plus from which monocytes were isolated using CD14⁺ magnetic beads according to manufacturer's protocol or, when more cells were needed, monocytes were isolated from monocyte apheresis products using centrifugal elutriation.¹ Monocytes were subsequently differentiated into immature dendritic cells (iDCs) by culturing them in Cellgro medium supplemented with 800 U/mL IL-4 and 1000 U/mL GM-CSF for 5 days.

Purification of FVIII and VWF

FVIII and VWF were purified as described previously.² Briefly, HEK293 stable cell lines expressing B-domain deleted FVIII or VWF were cultured in DMEM/F12 supplemented with 10% fetal calf serum. Proteins were purified from concentrated medium using immunoaffinity chromatography using Sepharose coupled with human monoclonal antibody VK34 or murine monoclonal antibody CLB-RAg20 for FVIII and VWF respectively. FVIII was purified further using Q sepharose ion-exchange. FVIII was stored in 50 mM Tris-HCl pH 7.4, 800 mM NaCl, 5 mM CaCl₂ and 50% glycerol and VWF was stored in 20 mM HEPES pH 7.4, 150 mM NaCl and 50% glycerol at -20°C until further use.

Purification of HLA-DR-bound peptides

HLA-DR/peptide complexes were purified as described previously.³⁻⁵ Five million monocyte-derived iDCs were incubated at 37°C with 25 nM FVIII, 250 nM VWF or FVIII/VWF complex at a ratio 1:5 or 1:10 obtained as described above. After 5 hours of incubation, cells were

maturated overnight by addition of 1 µg/mL of LPS in the presence of 1% pooled human serum. Subsequently, cells were lysed (10 mM Tris-HCl pH 7.0; 4% NP40, complete protease inhibitor cocktail) and HLA-DR/peptide complexes were purified employing an anti MHC class II L243-coupled CNBr Sepharose 4B column that was prewashed with 10 mM Tris-HCl pH 7.0, protease inhibitor cocktail. After this incubation the column was washed 3 times with 10 mM Tris-HCl pH 7.0 containing protease inhibitors and subsequently 5 times with 10 mM Tris-HCl pH 7.0 only. Next peptides were eluted employing 10% acetic acid at 70 °C for 15 minutes. C18 Stage-tips equilibrated with 100% acetonitrile and washed with 1% formic acid in H₂O were prepared. After loading of the sample, C18 Sepharose was washed twice with 1% formic acid and 1% formic acid supplemented with 5% acetonitrile. Peptides were then eluted with 1% formic acid in 50% acetonitrile.

Mass spectrometry analysis of purified peptides

Mass spectrometry was used for peptide analysis as previously described.^{3,5} Eluted peptides were separated using columns filled with 1.9 µm C18 particles (New Objective type FS360-75-8-N-5-C20, Inc., Woburn, MA, USA) at a flow rate of 300 nL/min with a gradient from 0% to 80% (v/v) acetonitrile in 0.1 M acetic acid. Column eluate was directly sprayed into the Orbitrap Fusion Tribrid mass spectrometer (Thermo Fisher Scientific Inc., Bremen, Germany) using nanoelectrospray source with a spray voltage of 2.15 kV. Higher-energy Collisional Dissociation (HCD) was performed in top-speed mode with 3 second cycles (400-1500 m/z, resolving power 120.000). The mass spectrometer was calibrated on a regular basis as recommended by the manufacturer in order to ensure a high mass accuracy.

Characterization of peptides

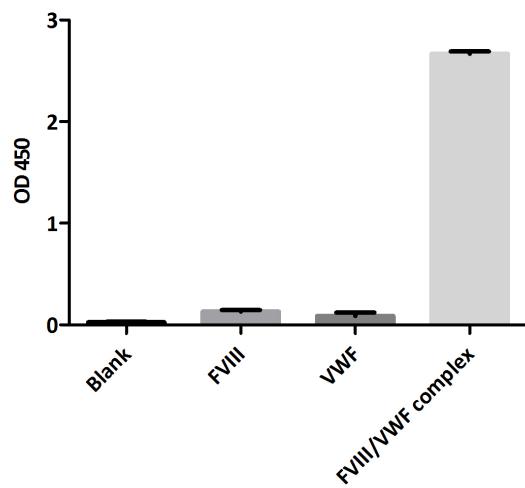

Peptides were identified using Proteome Discoverer 1.4 (Thermo Scientific, Bremen, Germany). Raw Xcalibur data files were screened against the UniprotKB non-redundant protein 25.H_sapiens.fase database with a mass deviation of 20 ppm, a fragment mass tolerance of 0.8 Da and a false positive discovery rate of 95%. All identified peptides were grouped and aligned for each donor after which core peptides were predicted using NetMHCII 2.2.²³ The core peptide with the highest predicted binding affinity was used to indicate the location of that specific group of identified peptides.

Statistical analysis

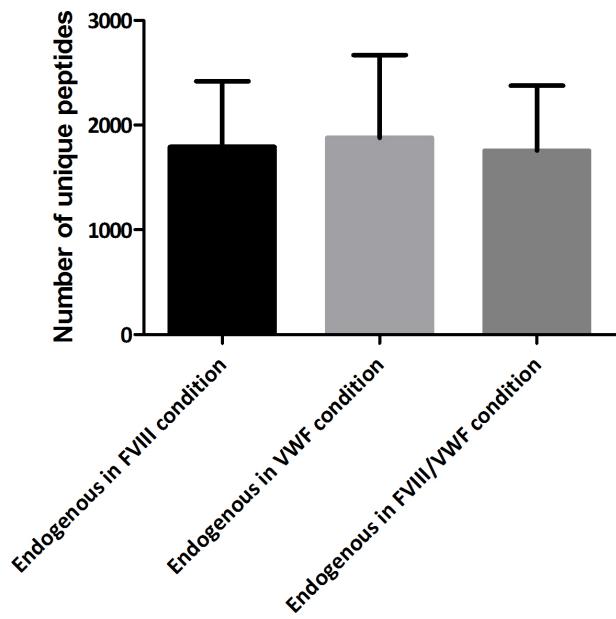

Statistical analysis was performed using Graphpad Prism 6 (GraphPad Software, Inc. La Jolla, CA, USA). Significance between groups of measured mean fluorescent intensities was assessed using an unpaired student's t-test or a one-way ANOVA with Bonferroni's multiple comparison correction.

Supplementary results

Supplementary figure S1. FVIII/VWF complex detection using ELISA. FVIII (25 nM) and VWF (250 nM) were incubated separately or in complex for 30 minutes at 37°C in Cellgro medium. Samples were 100x pre diluted in conjugate buffer (50mM Tris, 150 mM NaCl, 0.2% Tween-20) containing 0.22 μ g/mL DAKO polyclonal anti VWF PO labeled antibody. Subsequently, samples were incubated on a 2.5 μ g/mL CLB-CAg9 pre-coated plate for 1 hour at 37°C to capture FVIII after which VWF was detected by peroxidase hydrolysis of TMB. A clear signal increase was observed in the complex condition, indicating stable interaction between FVIII and VWF in this condition.

Supplementary figure 2. Total number of unique peptides discovered. Raw mass spectrometry data was analyzed using Proteome discoverer which detects endogenous proteins. A comparable level of total number of peptides identified is shown, which indicates that similar levels of material was analyzed.

Supplementary Figure S3. Overview identified peptides. Monocyte-derived dendritic cells from donors A, B, C, D and E were pulsed with FVIII (left half of the table) or with FVIII/VWF complex (right half of table). FVIII-derived peptides were selected and corresponding HLA-DRB1 genotype specific core peptides were predicted using NetMHCpan 2.8. The data is displayed for each donor separately. All identified FVIII-derived peptides were grouped according to their position within the protein. Bold peptides represent predicted core peptides with their predicted affinities. For each cluster of peptides the highest affinity core peptide was used as a representative marker for the peptides identified as shown in Figure 4 and Figure 5. Green clusters indicate peptides which were identified from cells which were pulsed with FVIII alone, while yellow clusters represent the identification of peptides after pulsing cells with FVIII/VWF complex which are found in both conditions. Clusters of red colored peptides indicate peptides only identified when cells are pulsed with FVIII/VWF and not when pulsed with FVIII only.
