Supplementary Material and Methods

Patients

Collection of blood samples from CLL patients was approved by the local ethics committee of the University of Cologne under IRB #11-140 and donors provided written consent in accordance with the Declaration of Helsinki. See Supplementary Table 1A and 1B for patient characteristics.

Cell culture

CLL and healthy B cells were purified using the RosetteSep Human B cell Enrichment Cocktail (StemCell) according to manufacturer's instructions and cultured in Panserin 411S medium (Pan-Biotech, Germany) for 38-45 hours with or without addition of 200nM CpG (ODN2006, sequence: TCgTCgTTTgTCgTTTgTCgTT, Thioate, PTO, produced at TIB Molbiol). Human Dermal Fibroblasts (HDF_n) and human monocytic cell line THP-1 were cultured in RPMI-1640 medium (Gibco) supplemented with 10% FBS.

Isolation of EVs, mRNA sequencing and bioinformatics

Vesicles were purified from cell supernatant by serial ultracentrifugation steps.¹ RNA extraction was performed with the RNeasy Mini Kit (Qiagen) according to manufacturer's instructions. RNA quantity and quality was assessed with Agilent 2200 TapeStation, NGS RNA sequencing was performed on the GAIIX (Illumina), and data were analyzed with DAVID Bioinformatics Resources 6.7 (NIAID/NIH). DAVID 6.7. was used for the KEGG pathway analysis and the functional annotation clustering was performed with the highest classification stringency. The KEGG-pathway function included in DAVID 6.7 was used to interpret the data in the context of biological processes, pathways and networks. Both up- and down-regulated identifiers were defined as value parameters for the analysis.

Co-culture with DiO-labeled cells and microscopy

Visualization of exosome uptake was performed after co-culture of CLL and HDF_n cells for 16 h. CLL cells were labeled with DiO (Molecularprobes) according to the manufacturer recommendations (cells were incubated with 5 µM DiO for 10 min). 0.5x10⁴ of HDF_n and 5.0x10⁵ of CLL cells were grown in 500 µl of RPMI in 4 Chamber 35 mm Glass Bottom Dishes (Cellvis) and life cell imaging was performed on Nikon Spinning Disc confocal microscope.

Quantitative real time PCR (qRT-PCR)

RNA from CLL B-cells, THP-1 macrophages or HDF fibroblasts was isolated using RNeasy Kit (Qiagen, Germany) according to manufacturer's instructions, and quality and quantity of RNA was assessed with Nanodrop1000 (Thermo Scientific, Schwerte, Germany). For cDNA synthesis, 1µg of total RNA was reverse transcribed using SuperScript® VILO™ cDNA Synthesis Kit (Thermo Fisher Scientific, Germany), and 50ng cDNA was used per 1 qRT-PCR reaction. Primer sequences were designed using LasergenePrimerSelect software (DNASTAR, USA) and are summarized in Supplementary Table 3. PCR was performed using SYBR® Green PCR Master Mix (Applied Biosystems, USA) on the Applied Biosystems 7500 Real-Time PCR machine. Levels of β-actin or β-tubulin transcripts served for normalization.

CD63, CD9, TCL1A Western blot

Western blots included SDS gel electrophoresis and transfers onto nitrocellulose membranes by standard methods.

The primary antibody against CD9, CD63 (Biolegend), β-actin (Sigma), TCL1A² and horseradish peroxidase (HRP)-labeled secondary antibodies (Cell Signaling) were used to detect specific signals. The activity of HRP was visualized with ECL substrate (Promega). Primary antibodies were diluted 1:200, secondary antibody was diluted 1:10.000.
