Version 3

Mixed-species RNAseq analysis of human lymphoma cells adhering to mouse stromal cells identifies a core gene set that is also differentially expressed in the lymph node microenvironment of mantle cell lymphoma and chronic lymphocytic leukemia patients

Gustav Arvidsson, Johan Henriksson, Birgitta Sander, and Anthony P. Wright

Disclosures: The study was supported via grants from: The Swedish Research Council, (AW), The Swedish Cancer Society (AW, BS), The Cancer Society in Stockholm (BS), The Stockholm County Council (BS) and Karolinska Institutet (AW, BS)

Contributions: GA was involved in conception of the study and performed the experimental work, data analysis and writing of the manuscript. JH contributed to the data analysis. BS and AW contributed to conception of the study, interpretation of data and writing of the manuscript. RNAseq library construction and sequencing was performed by the core facility BEA, Bioinformatics and Expression Analysis at the Karolinska Institute.
