

Clinical features of adult patients with EBV-positive T/NK-cell lymphoproliferative disorder and chronic active EBV infection-like features

Chronic active Epstein-Barr virus infection (CAEBV)

54

Adult-onset CAEBV patients

75

Pediatric-onset CAEBV patients

	≥ 15 years	≤ 15 years	
Estimated age of onset	≥ 15 years	≤ 15 years	
Median age of onset	39 years (range: 16-86 years)		
Fever, n (%)	35 (64.8)	65 (86.7)	<i>P</i> =0.005
Skin rash, n (%)	21 (38.9)	9 (12.0)	<i>P</i> <0.001
Hypersensitivity to mosquito bites, n (%)	4 (7.4)	27 (36.0)	<i>P</i> <0.001
Hydroa vacciniforme, n (%)	2 (3.7)	13 (17.3)	<i>P</i> =0.0238
Thrombocytopenia, n (%)	26 (48.1)	34 (45.3)	<i>P</i> =0.481
Hemophagocytic syndrome, n (%)	25 (46.3)	17 (22.7)	<i>P</i> =0.0073
Prognosis	Poorer		<i>P</i> <0.001

Adult-onset CAEBV has poorer characteristics compared to that for pediatric-onset CAEBV
