

# The -7/del(7q) clonal chromosome abnormalities in Philadelphia negative cells have a poor prognostic value in chronic myeloid leukemia patients

Retrospective French multicenter study

102

Chronic myeloid leukemia (CML) patients with clonal chromosome abnormalities in Philadelphia negative cells (CCA/Ph-)

11

Abnormality of chromosome 7 (-7/del(7q))

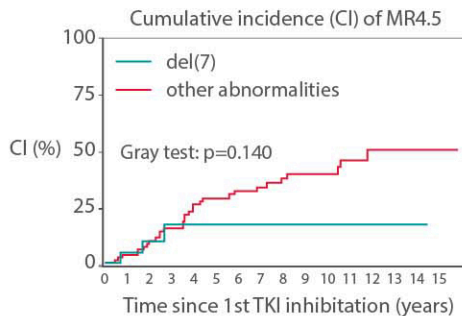

11

Myelodysplastic syndromes (MDS) patients without CML history presenting abnormal karyotype (control group)

4

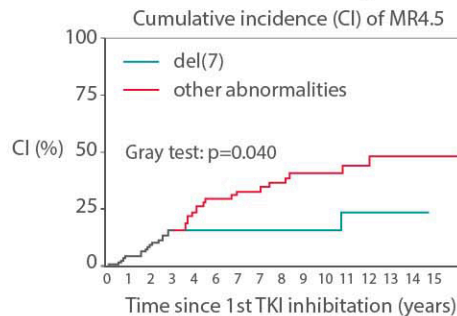

Abnormality of chromosome 7 (-7/del(7q))

Median time to MR4.5 after 1st TKI (years)

del(7)	other abnormalities	p
2.3 [0.66-10.5]	3.55 [0.5-11.77]	NS

## Landmarked analyses

Landmarked analysis after 3 years of therapy identified adverse effect of -7/del(7q) CCA Ph- ( $p=0.04$ )

- Landmarked analyses at 3 years after first TKI initiation revealed a strong negative impact of -7/del(7q) CCA Ph- on event-free survival ( $p=0.015$ ) and progression-free survival ( $p=0.022$ )
