# Extended anticoagulant therapy in venous thromboembolism: a balanced, fractional factorial, clinical vignette-based study 

Ten Cate V, Lensing AWA, Weitz JI, Beyer-Westendorf J, Wells PS, Mismetti P, Prandoni P, Cohen AT, Davidson BL, Prins MH.

## Table of contents

| Table | Title | Pag |
| :--- | :--- | :--- |
|  |  |  |
| S1 | Vignette risk factors and levels | 2 |
| S2 | Region and country of practice of the study participants | 3 |
| S3 | Standard deviations of the included random effects: risk of recurrent VTE | 4 |
| S4 | Standard deviations of the included random effects: risk of bleeding | 5 |
| S5 | Discontinuing anticoagulation | 6 |
| S6 | Predictive metrics and fit: Continuing anticoagulation | 7 |
| S7 | Treatment choices, compared to treatment cessation | 8 |
| S8 | Predictive metrics and fit: Treatment choices, compared to treatment cessation | 9 |
| S9 | Confusion matrix of actual versus predicted choices | 10 |

## S1: Vignette risk factors and levels

| Risk factor | Level 1 (reference) | Level 2 | Level 3 | Level 4 | Level 5 | Level 6 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Sex | Female | Male |  |  |  |  |
| Age | <65 years | $\geq 65$ years |  |  |  |  |
| BMI | Normal | Low | High |  |  |  |
| Unprovoked VTE | No | Yes |  |  |  |  |
| Presentation and site of VTE | Distal DVT | Distal DVT with signs of PTS | Proximal DVT | Proximal DVT with signs of PTS | Nonmassive PE* | Massive PE |
| Previous VTE | No | Yes (within 2 years) |  |  |  |  |
| Family history of VTE | No | Yes |  |  |  |  |
| History of major bleeding | No | Yes |  |  |  |  |
| Thrombophilia | None | Acquired | Hereditary |  |  |  |
| Renal function | Normal | Impaired ( $\mathrm{CrCl}<50$ $\mathrm{mL} / \mathrm{min}$ ) |  |  |  |  |
| Alcohol or substance abuse | No | Yes |  |  |  |  |
| Absolute indication for aspirin | No | Yes |  |  |  |  |

* I.e., hemodynamically stable PE.

Abbreviations: BMI, body mass index; CrCl , creatinine clearance; $D V T$, deep vein thrombosis; $P E$, pulmonary embolism; PTS, post-thrombotic syndrome; VTE: venous thromboembolism.

## S2: Region and country of practice of the study participants

| Region and country of practice | Sample size, n (\%) |
| :--- | :--- |
| Total number of participants | $253(100)$ |
| Western Europe | $100(40)$ |
| Austria | $5(5)$ |
| Belgium | $5(5)$ |
| Denmark | $3(3)$ |
| France | $16(16)$ |
| Germany | $14(14)$ |
| Italy | $12(12)$ |
| Netherlands | $17(17)$ |
| Norway | $2(2)$ |
| Spain | $9(9)$ |
| Sweden | $2(2)$ |
| Switzerland | $12(12)$ |
| United Kingdom | $3(3)$ |
| Eastern Europe | $33(13)$ |
| Croatia | $1(3)$ |
| Czech Republic | $6(18)$ |
| Estonia | $1(3)$ |
| Hungary | $10(30)$ |
| Poland | $2(6)$ |
| Russia | $13(39)$ |
| Turkey | $3(1)$ |
| Turkey | $3(100)$ |
| Israel | $22(9)$ |
| Israel | $22(100)$ |
| North America | $25(10)$ |
| United States | $10(40)$ |
| Canada | $15(60)$ |
| South America | $15(6)$ |
| Argentina | $1(38)$ |
| Brazil | $1(7)$ |
| Mexico | $11(73)$ |
| East Asia | $3(20)$ |
| China | $10(4)$ |
| South East Asia | $11(100)$ |
| Philippines | $7(3)$ |
| Thailand | $2(29)$ |
| Vietnam | $2(29)$ |
| Oceania | $3(43)$ |
| Australia | $30(12)$ |
| New Zealand | $20(67)$ |
| Africa | $10(33)$ |
| Ghana | $8(3)$ |
|  | 3 Africa |

# S3: Standard deviations of the included random effects: risk of recurrent VTE 

|  | Standard deviations random effects: risk of recurrent VTE |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Percentile | Intercept | Previous <br> VTE | Family history of <br> VTE | Aspirin indication |  |
| $10^{\text {th }}$ | 7.9 | 8.7 | 0.0 | 0.0 |  |
| $50^{\text {th }}$ | 8.5 | 7.4 | 2.6 | 5.5 |  |
| $90^{\text {th }}$ | 6.2 | 0.0 | 0.0 | 0.0 |  |

Interpretation:
The standard deviations of the random effects reflect the degree of variability in risk estimates between physicians with respect to the variables shown. The intercept reflects the baseline difference in risk assessment: two physicians may assess the thrombotic risk of the same patient differently, even when they otherwise agree on the impact of a given risk factor. The remaining standard deviations indicate the variability between physicians with respect to the coefficients of the shown variables. For instance, this means that there is considerable variation between how physicians assess the impact of a previous $V T E$ in low to moderate risk patients, while there is virtually no disagreement between physicians in assessing this same risk in high risk patients. In high risk patients, only the baseline risk estimates vary.

S4: Standard deviations of the included random effects: risk of bleeding

|  | Standard deviations random effects: bleeding risk |  |  |  |
| :---: | :---: | :---: | :---: | :---: |

## S5: Discontinuing treatment

| Risk factor | Odds ratio $(95 \% \mathrm{CI})$ |
| :--- | :--- |
|  |  |
| Male sex | $0.77(0.61 \text { to } 0.98)^{*}$ |
| Idiopathic | $0.40(0.31 \text { to } 0.51)^{\#}$ |
| Distal DVT with signs of PTS | $0.59(0.42 \text { to } 0.82)^{* *}$ |
| Proximal DVT | $0.04(0.03 \text { to } 0.07)^{\#}$ |
| Proximal DVT with signs of PTS | $0.13(0.09 \text { to } 0.19)^{\#}$ |
| Non-massive PE | $0.19(0.13 \text { to } 0.27)^{\#}$ |
| Massive PE | $0.11(0.08 \text { to } 0.17)^{\#}$ |
| Previous VTE (2 years ago) | $0.30(0.24 \text { to } 0.38)^{\#}$ |
| Family history of VTE | $0.74(0.59 \text { to } 0.93)^{*}$ |
| History of major bleeding | $1.33(1.06 \text { to } 1.67)^{*}$ |
| Acquired thrombophilia | $0.90(0.68$ to 1.19$)$ |
| Hereditary thrombophilia | $1.31(0.99$ to 1.74$)$ |
| Renal insufficiency (CrCl<50mL/min) | $0.74(0.59$ to 0.93$) *$ |
| Substance abuse | $1.33(1.06 \text { to } 1.68)^{*}$ |
| Absolute indication for aspirin | $1.83(1.45 \text { to } 2.31)^{\#}$ |
|  |  |
| Specialist characteristic | Odds ratio $(95 \% \mathrm{CI})$ |
|  |  |
| Patients seen annually | $0.97(0.63$ to 1.48$)$ |
| 25-49 | $1.38(0.93$ to 2.04$)$ |
| 50-99 | $1.98(1.34 \text { to } 2.94)^{\#}$ |
| 100-149 | $1.64(1.15 \text { to } 2.36)^{* *}$ |
| 2150 |  |
| Region of practice | $0.23(0.14 \text { to } 0.35)^{\#}$ |
| Eastern Europe | $0.36(0.22 \text { to } 0.56)^{\#}$ |
| Israel | $0.87(0.58$ to 1.29$)$ |
| North America | $0.31(0.17 \text { to } 0.53)^{\#}$ |
| South America | $0.27(0.13 \text { to } 0.53)^{\#}$ |
| East Asia | $0.56(0.27$ to 1.11$)$ |
| South East Asia | $0.90(0.46$ to 1.73$)$ |
| Africa | $0.39(0.08$ to 1.43$)$ |
| Turkey | $1.34(0.95$ to 1.90$)$ |
| Oceania |  |

* $p<0.05$; ** $p<0.001 ;{ }^{\#} p<0.0001$. Abbreviations: CI, confidence interval; CrCl , creatinine clearance; DVT, deep vein thrombosis; OR, odds ratio; PE, pulmonary embolism; PTS, post-thrombotic syndrome; VTE, venous thromboembolism.

S6: Predictive metrics and fit: Continuing anticoagulation

| AUROC | Predictive accuracy on test set | McFadden's $\rho^{2}$ |
| :---: | :---: | :---: |
| 0.83 | $80.25 \%$ | 0.24 |

Abbreviations: AUROC, area under the receiver operating characteristic curve.
Interpretation:
The AUROC indicates the discriminatory ability of the predictive model. An AUROC of 0.50 indicates no predictive ability, while a model with an AUROC of 1.00 can perfectly discriminate between (and thus predict) two options. A McFadden's $\rho^{2}$ of 0.20 or more indicates good model fit.

S7: Treatment choices, compared to treatment cessation

|  | Treat 6 months | Treat 12 months | Treat indefinitely | Switch to aspirin |
| :---: | :---: | :---: | :---: | :---: |
| 2isk factor | OR (95\% CI) | OR (95\% CI) | OR (95\% CI) | OR (95\% CI) |

| Turkey | 1.44 (0.23-8.82) | 7.53 (1.18-48.15) | 2.06 (0.34-12.49) | 0.68 (0.06-8.06) |
| Oceania | 0.84 (0.52-1.37) | 0.42 (0.20-0.88) | 0.95 (0.60-1.52) | 1.29 (0.78-2.14) |

Reference categories are shaded; reference categories for dichotomous variables are omitted. Abbreviations: CI, confidence interval; CrCl, creatinine clearance; DVT, deep vein thrombosis; $O R$, odds ratio; PE, pulmonary embolism; PTS, post-thrombotic syndrome; VTE, venous thromboembolism.

Interpretation: this table shows the results of a multinomial logistic regression model, with treatment cessation as the reference choice. Odds ratios with confidence intervals that contain 1 are not statistically significant.

## S8: Predictive metrics and fit: Treatment choices, compared to treatment cessation

| Choice | AUROC | Predictive accuracy on test set | McFadden's $\rho^{2}$ |
| :--- | :---: | :---: | :---: |
| Combined | 0.62 | $51.26 \%$ | 0.20 |
| 6 months | 0.70 | $78.29 \%$ | - |
| 12 months | 0.66 | $84.31 \%$ | - |
| Indefinite | 0.81 | $73.53 \%$ | - |
| Stop | 0.85 | $86.97 \%$ | - |
| Aspirin | 0.78 | $90.19 \%$ | - |

## Interpretation:

This table shows that, while the multinomial model demonstrates adequate fit (and so the coefficient estimates are reliable), its discriminatory ability (ability to predict specific treatment choices) is poor (multiclass AUROC=0.62). It also shows that when individual choices are modeled separately (against all other choices), using binomial logistic regression, the model predicts choices fairly well. In other words, the predicted probabilities for individual choices are reasonably accurate, but the combined (multinomial) model fails to discriminate between separate options, because the predicted probabilities are too close to one another. This result indicates that not enough information was present to differentiate between treatment choices. An alternative explanation is that this decision-making process has a random element to it that eludes prediction altogether.

## S9: Confusion matrix of actual versus predicted choices

|  | Predicted choice |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Actual choice | Stop | 6 months | 12 months | Indefinite | Aspirin | Sum |
| Stop | 50 | 25 | 0 | 18 | 9 | 102 |
| 6 months | 18 | 66 | 10 | 52 | 15 | 161 |
| 12 months | 9 | 25 | 21 | 47 | 7 | 109 |
| Indefinite | 11 | 35 | 9 | 209 | 7 | 271 |
| Aspirin | 15 | 14 | 2 | 20 | 20 | 71 |
| Sum | 103 | 165 | 42 | 346 | 58 | 714 |

Interpretation:
This table depicts the actual choices that were made (in the test set, i.e., the $20 \%$ of data unseen during modelling) versus the choices predicted by the multinomial model. This table, like S8, illustrates how the model fails to adequately predict separate choices; only the 'indefinite anticoagulation' option is predicted correctly in the majority of instances.
