Supplementary Methods

Case selection. Twenty-one cases of primary histiocytic sarcoma (pHS) with a tumor content of at least 40% were identified from the files of the Hematopathology Section of the National Cancer Institute under an IRB approved protocol. All cases were reviewed by a panel of hematopathologists (ESJ, SP, CE, AN). Cases were defined as pHS if they showed typical histomorphology and expression of at least two of CD68, CD163, CD4 and lysozyme, no expression of CD20, CD3, CD30, no markers of Langerhans cell or follicular dendritic cell differentiation, and no known history of lymphoid malignancy or mediastinal germ cell tumor. One patient had a history of myelodysplastic syndrome with del(5q), but the cytogenetic aberration was not present in the HS. One case had insufficient material for a complete immunohistochemical panel but had an appropriate morphology and expressed histiocytic markers. The histologic and immunophenotypic features and clonality characteristics of the 21 cases are detailed in **Figure 1** and **Supplementary Table S3**.

Immunohistochemistry. Additional immunohistochemical studies were performed using antibodies to CD68 (KP-1, predilute; Roche, Indianapolis, IN, USA), CD163 (MRQ-26, predilute; Cell Marque, Rocklin, CA, USA), lysozyme (EC.3.2.1.17, 1:2000; Dako, Santa Clara, CA, USA), CD4 (SP35, predilute; Roche), CD21 (1F8, 1:30; Dako), clusterin (41D, 1:5000; Millipore, Burlington, MA, USA), CD1a (EP3622, predilute; Roche), langerin (12D6, 1:200; Leica Biosystems, Buffalo Grove, IL, USA), CD30 (JCM182, predilute; Leica Biosystems), CD20 (L26, predilute; Roche), CD3 (2GV6, predilute; Ventana, Tucson, AZ, USA), S100 (15E2E2, 1:8000; BioGenex, Fremont, CA, USA), AE1/AE3 (AE1/AE3, 1:100; Dako) and Ki67 (MIB-1, 1:200; Dako) if required. Immunohistochemistry was performed on either a Ventana Benchmark Ultra automated immunostainer using UltraView detection (Ventana) or on a Leica Bond Max using Bond Polymer Refine detection systems (Leica Biosystems). The proliferation index obtained using Ki67 immunohistochemistry was the percentage of positive cells counted in three high power fields (400x). Images were taken using an Olympus Microscope Digital Camera Model DP71 on an Olympus BX50 microscope and cells were counted with the Cell Counter plugin in ImageJ (<https://imagej.nih.gov/ij/index.html>)¹.

Nucleic acid extraction. DNA and RNA were extracted from formalin-fixed paraffin embedded (FFPE) tissue sections using QIAGEN QIAamp DNA FFPE Tissue Kit and RNeasy FFPE Kit on a QIAcube robotic system according to the manufacturer's protocol (QIAGEN, Germantown, MD, USA). Co-extraction, when performed, used a modified version of the QIAGEN AllPrep DNA/RNA FFPE protocol.

Immunoglobulin gene and T-cell receptor gene rearrangement studies. Polymerase chain reaction (PCR) for immunoglobulin gene (IGH and IGK loci) and T-cell receptor gene (TRG locus) rearrangements was performed according to methods described in detail elsewhere^{2,3}. To interrogate IGH rearrangements, laboratory designed consensus primers directed against V_H framework II, V_H framework III and the joining region (J_H) were employed as described previously^{4,5}, or alternatively, commercially available BIOMED-2 primer sets to all three V_H framework regions (Invivoscribe Technologies, San Diego, CA, USA) were used. IGK analysis was performed using the commercially available BIOMED-2 primer sets (Invivoscribe Technologies) and interrogated rearrangements involving the V_k loci and J_k (Tube A), the V_k locus and the κDE locus (Tube B) and the κ-intron RSS locus and the κDE locus (Tube B)⁶ as described by the supplier. The TRG locus was assessed using a single multiplexed PCR reaction, with primers directed at all known V_γ family members and the J_γ1/2, JP1/2 and JP joining segments³. PCR products were separated by capillary electrophoresis on an ABI 3130xl Genetic Analyzer (Applied Biosystems, Foster City, CA, USA) and electropherograms were analyzed using GeneMapper software version 4.0.

IGH/BCL2 (MBR) translocation. PCR was performed using assays modified from a previous study⁷ designed to detect translocations between the major breakpoint region (MBR) of *BCL2* on chromosome 18q21 and the IGH joining region (J_H) on chromosome 14q32. The primers/probe sequences used were: *BCL2*: 5' –TTAGAGAGTTGCTTTACGTGGCCTG–3', *JHα*: 5'–ACCTGAGGAGACGGTGACC–3', *BCL2 probe*: FAM-CACACAGACCCACCCAG. The PCR reaction was 50 μL in total volume composed of 25 μL QUANTITECT Master Mix Buffer 2X (QIAGEN), 2.5 μL of GAPDH primer/probe mix, 2.5 μL of IGH/*BCL2* primer/probe mix and 15 μL nuclease-free water with a sample DNA input of 5 μL. The reaction was incubated at 95°C for 15 minutes and run for 45 cycles of 95°C for 45 seconds followed by 60°C for 60 seconds.

Whole exome sequencing. Library preparation was performed using Agilent SureSelect^{XT} Human All Exon V5 + UTRs target enrichment kit (Agilent Technologies, Santa Clara, CA, USA). Sequencing was performed on either an Illumina HiSeq2500 with TruSeq V4 chemistry or on an Illumina HiSeq3000 with TruSeq V2 chemistry (Illumina, San Diego, CA, USA). Reads were trimmed using Trimmomatic v0.33⁸ and mapped to the hs37d5 version of the human reference genome (ftp://ftp.1000genomes.ebi.ac.uk/vol1/ftp/technical/reference/phase2_reference_assembly_sequence/hs37d5.fa.gz) using BWA-MEM v07.15⁹. Following alignment, BAM files were processed using Samtools v1.3 (<http://www.htslib.org/>)¹⁰ and duplicates were marked using Picard v2.1.1

(<http://broadinstitute.github.io/picard/>). GATK v3.5.0¹¹ was used to perform indel realignment and base recalibration. Read- and alignment-level quality control visualization was performed using MultiQC v1.1 (<http://multiqc.info/>)¹² to aggregate QC metrics from FastQC (<http://www.bioinformatics.babraham.ac.uk/projects/fastqc/>), FastQ Screen (https://www.bioinformatics.babraham.ac.uk/projects/fastq_screen/), Picard, BamTools stats (<http://github.org/pezmaster31/bamtools>)¹³ and Trimmomatic.

Variant calling was performed with MuTect 1.1.7 and MuTect2¹⁴. A panel of normals, developed from ExAC (excluding the TCGA) r0.3.1¹⁵ and the 1000 Genomes Project¹⁶ including only variants > 0.001 in frequency in the general population was used in cases without a matched germline. Tumor variants with an allele frequency of ≤ 0.05 and ≥ 0.99 were excluded. Variants were annotated using Ensembl VEP 92¹⁷, CADD GRCh37-v1.4¹⁸ and the COSMIC database v88 (<http://cancer.sanger.ac.uk>)¹⁹.

Identification of target genes. As matched germline samples were unavailable in most cases, we focused on genes with a known role in cancer to reduce the number of variants for assessment, an approach similar in concept to using a targeted sequencing panel. Genes were obtained from the COSMIC Cancer Gene Census v88 (<http://cancer.sanger.ac.uk>)²⁰, excluding genes that were germline only or only associated with the terms 'T' (translocation), 'F' (fusion), 'A' (amplification) or 'D' (large deletions) and from a review of relevant literature (**Supplementary Table S2**), designed to also include genes associated with RASopathies²¹⁻²⁴ and lymphoid malignancies²⁵⁻⁴⁹, as histiocytic sarcoma is known to harbor RAS pathway mutations and may be associated with B- and T-cell neoplasms. Genes from the exome data were included if they were mutated in ≥ 3 samples following application of the coverage, CADD score and minor allele frequency filters (described below) and verification of the mutations in the Integrative Genomics Viewer (IGV)⁵⁰. The resulting targeted gene list (430 genes) is presented in **Supplementary Table S9**.

Variant filtration. Synonymous mutations and variants in UTRs, intronic and intergenic locations and in the mitochondrial genome were excluded. Variants with < 6 reads and < 20x coverage by read proportions were also excluded. We applied a stringent filter based on population allele frequencies to remove as many potential germline events as possible, retaining only those mutations with a total allele frequency of < 0.0001 and a total allele count of < 10 in the Genome Aggregation Database (gnomAD), v2.1 (non-cancer)¹⁵. We also removed any variant that was filtered from the COSMIC database as a SNP. As recognized pathogenic, somatic mutations may be present in population

databases, we included mutations that were present at a higher frequency/allele count only if documented in ClinVar⁵¹ as both pathogenic and somatic. This resulted in the addition of a single *JAK2* p.V617F mutation to the dataset. Finally, only variants with a CADD phred-like score¹⁸ of > 20 and that passed manual inspection in IGV⁵⁰ were retained.

In the cases without a matched germline sample, variants in the targeted gene list meeting one of the following criteria were considered significant:

- (1) Present in a recurrently mutated gene (gene mutated in ≥ 4 samples).
- (2) Splice site or nonsense mutation, or frameshift or in-frame insertion/deletion.
- (3) Variant is present recurrently (mutation count ≥ 2) in the COSMIC database v88 (<http://cancer.sanger.ac.uk>)¹⁹ or designated as pathogenic/likely pathogenic in ClinVar⁵¹.
- (4) Variant is present once in the COSMIC database v88 (<http://cancer.sanger.ac.uk>)¹⁹ but occurs within a known hotspot/domain described in the literature.

See **Supplementary Figure S1**.

This approach yielded 125 mutations in 63 genes (range: 1-16 mutations per case; median: 4 mutations per case). All variants had a population allele frequency of <0.0001 with the exception of *JAK2* p.V617F (0.0003295). **Figure 2** provides an overview of the major genes and pathways mutated and the complete list of mutations classed as significant by our algorithm is reported in **Supplementary Table S4**.

RNA library preparation and sequencing. Whole transcriptome sequencing was performed on 17 tumor samples in two groups, with four samples of reactive nodal histiocytic infiltrates sequenced in parallel for comparison as normal tissue. Libraries were prepared for both groups using NEBNext[®] Ultra[™] RNA Directional Library Prep Kit for Illumina (New England Biolabs, Inc., Ipswich, MA, USA). Samples were pooled and sequenced on an Illumina HiSeq2500 with TruSeq V4 chemistry (Illumina). Three technical replicates from the first group were sequenced with the second group to control for batch effect.

RNA sequencing. RNA-Seq analysis was conducted using the CCBR RNA-Seq pipeline (<https://github.com/CCBR/Pipelinier>). For RNA-Seq gene expression analysis, contaminating adapter sequences were removed using Trimmomatic v0.36⁸. Trimmed reads were mapped to the GRCh37 human reference genome using STAR v2.5.3⁵² run in 2-pass mode. RSEM v1.3.0⁵³ was used for gene-level expression quantification, and edgeR v3.20.8⁵⁴ was used to assess differential expression. Batch

correction was performed using ComBat, a component of the SVA package v3.26.0⁵⁵ implemented in R. Only genes expressed at a level of 10 raw counts and with a CPM of at least 0.8 in a minimum of 4 samples based on the size of the smallest library were carried forward for differential expression analysis. Following exploratory visualization of the data, three samples were outliers and excluded from further analysis.

Read- and alignment-level quality was assessed using MultiQC v0.9 (<http://multiqc.info/>)¹² to aggregate QC metrics from FastQC (<http://www.bioinformatics.babraham.ac.uk/projects/fastqc/>), FastQ Screen (https://www.bioinformatics.babraham.ac.uk/projects/fastq_screen/), Picard, RSeQC (<http://rseqc.sourceforge.net/>) and Trimmomatic.

Fusion detection and confirmation. Potential fusion transcripts were identified using STAR-fusion (<https://github.com/STAR-Fusion/STAR-Fusion/>) and FusionCatcher 0.99.6a⁵⁶. Candidate fusion transcripts were validated using FusionInspector (<https://github.com/FusionInspector/FusionInspector/>) and those that retained support were retained for further analysis. The oncogenic potential of the identified fusions was predicted using OncoFuse v1.1.1⁵⁷. A *TTYH3-BRAF* fusion was confirmed by RT-PCR with primers designed using OligoAnalyzer on the Integrated DNA Technologies website (<https://www.idtdna.com>) and by fluorescent in-situ hybridization (FISH) using a commercially available dual color *BRAF* (7q34) Break Apart probe (Empire Genomics), as described below.

Copy number analysis. Copy number was estimated from the exome sequencing data using default settings for CNVkit v0.8.5⁵⁸ and PureCN v1.8.1⁵⁹ against a pooled reference of the simultaneously sequenced normal samples. B-allele frequencies were calculated using matched germline samples. In cases without a matched sample, allele specific copy number values were inferred from a reference derived from 1000 genome SNPs. Data from CNVkit was exported in nexus.ogt format and processed using the SNP-FASST2 algorithm in Nexus 9.0 Software (BioDiscovery, Hawthorne, CA) for manual review and annotation. Subsequently, copy number alterations called by both algorithms were further reviewed with specific reference to gains and losses involving genes of the COSMIC Cancer Gene Census²⁰ and losses involving genes in the Tumor Suppressor Gene Database (TSGene 2.0)⁶⁰. Nine samples were successfully processed using the OncoScan CNV FFPE Assay (Affymetrix, Santa Clara, CA) according to the manufacturer's protocol. Copy number and LOH calls were made using the TuScan algorithm and were visualized and compared across samples using Nexus 9.0 Software (BioDiscovery). Re-centering and individual sample visualization were performed using

Chromosome Analysis Suite (ChAS) 3.3 (Thermo Fisher Scientific, Waltham, MA, USA). One sample was suboptimal for assessment by both OncoScan and exome copy number analysis [His17]. Another sample [His16] was assessed using only the SNP-FASST2 algorithm to allow re-centering of a non-diploid genome.

Graphics and data visualization. In addition to the software and packages mentioned above, R 3.4.3 (<https://www.R-project.org>) and Bioconductor 3.6 packages *chimeraviz*⁶¹ and *DGCA*⁶² were used to visualize data and generate graphics. Lollipop plots were created using *Maftools*⁶³. **Figure 2, Figure 6A and Supplementary Figure S1** were generated using Microsoft Excel (2016) and Microsoft PowerPoint (2016). Heatmaps were generated using the ClustVis webtool⁶⁴. Photomicrographs of H&E/immunohistochemistry stained sections were taken using an Olympus Microscope Digital Camera Model DP73 on an Olympus BX53 microscope (Olympus, Shinjuku, Tokyo, Japan) and the main and supplementary figures were edited and assembled in Adobe Photoshop.

Validation of *BRAF-TTYH3* fusion by RT-PCR. cDNA was synthesized with SuperScript VILO cDNA Synthesis Kit (Invitrogen, Thermo Fisher Scientific, Waltham, MA, USA) according to the manufacturer's instruction, using 1 µg each of His06 (*TTYH3-BRAF* fusion positive RNA) and His13 (negative control RNA). Primers to detect the fusion junction between *TTYH3* exon 12 and *BRAF* exon 8 were designed using OligoAnalyzer on the Integrated DNA Technologies website (<https://www.idtdna.com>) and purchased from IDT. A concurrent set of RT-PCR reaction was performed using a GUSB Primer Mix (Integrated DNA Technologies) for RNA/cDNA quality control. Primer sequences are detailed in **Supplementary Table S10**. The RT-PCR reactions were incubated at 95°C for 15 minutes, run for 48 cycles of 94°C for 20 seconds, 52°C for 20 seconds and 72°C for 30 seconds, and then terminated at 72°C for 5 minutes. Gel electrophoresis was performed for 7 µl of each PCR reaction on a 2.2% FlashGel DNA Cassette (Lonza, Basel, Switzerland) with FlashGel #57033 DNA size marker for size confirmation of the PCR products.

Fluorescent in-situ hybridization (FISH). Details of the FISH probes used are presented in **Supplementary Table S11**. Depending on available material, 3 to 5 µm thick sections were cut from FFPE tissue for FISH analysis. The slides were incubated for 1 hour at 60°C to melt paraffin, and subsequently deparaffinized in xylene and rehydrated in a decreasing ethanol series finishing with PBS washes. Slides were steamed for 30 minutes in IHC-TEK epitope retrieval solution (IHC World, Ellicott City, MD, USA). Digestion was performed using a solution of 100 mg/ml of Pepsin stock

(Sigma, St. Louis, MO, USA) and 0.01 N HCL at 37°C. Probes were pre-denatured at 78°C for 10 minutes in provided hybridization buffer and applied to the slides. Co-denaturation was performed on the Thermobrite System (Abbott Molecular, Des Plaines IL, USA) at 73°C for 5 minutes, followed by cooling to 37°C and transferal to a humid chamber for overnight hybridization in a 37°C oven. The slides were then washed in 0.4 x SSC (K.D Medical, Columbia, MD, USA)/0.3% Tween20 (Sigma) at 72°C for 2 minutes followed by immersion for 1 minute in 2 x SSC (K.D Medical)/ 0.1% Tween20 (Sigma) at room temperature and counterstained with 4',6-diamidino-2-phenylindole (VECTASHIELD Mounting Medium with DAPI, Vector Laboratories, Burlingame, CA, USA).

Images were captured using Bioview Duet Automatic Imaging System v3.7.0.6 (Bioview, Billerica, MA, USA). Approximately twenty images were scanned at 60x on an Olympus BX61 microscope with the appropriate filter. The images were analyzed on a Bioview SOLO workstation. A minimum of 100 non-overlapping nuclei were counted in samples with adequate signals. Copy number loss was called if the total ratio of the locus-specific probe to the reference probe was < 0.8.

Assessment of GI site and cell cycle in the tumor subgroups. Heatmap visualization of the log transformed normalized counts of the differentially expressed genes between tumor (both subgroups) and normal samples (FDR < 0.05 and absolute log FC of > 1, 2205 genes) using Euclidean distance with complete linkage (**Supplementary Figure S5**) shows segregation of the tumor samples into the subgroups correlating with *NF1/PTPN11* status, as was observed during unsupervised clustering.

A list of GI site-related genes was compiled using the top 100 expressed genes in the small intestine, sigmoid colon and transverse colon from the GTEx Portal, Release v7 (<https://www.gtexportal.org/home/>) and the GI-related tissue signatures from the BioQC package (Colon_NGS_RNASEQATLAS_0.6_3, Intestine_Colon_NR_0.7_3 and Intestine_small_NR_0.7_3)⁶⁵. Twenty-seven genes from the GI site list (**Supplementary Table S6**) were among the differentially expressed genes between the tumor and normal samples and were removed. The heatmap was re-drawn using the remaining 2178 genes. The intratumoral clustering by *NF1/PTPN11* status was unchanged (**Supplementary Figure S6**); however, a group of 136 genes (**Supplementary Table S7**) were clearly differentially expressed between the tumor subgroups (indicated in the heatmap, **Supplementary Figure S6**, by the red box). Functional enrichment performed on these 136 genes using ToppFun (<https://toppgene.cchmc.org>) showed enrichment for cell cycle-related biological processes (**Supplementary Table S8**) and removal of these cell cycle-related genes from the differentially expressed genes and re-drawing of the heatmap resulted in alteration of the clustering

with the *NF1/PTPN11* subgroup no longer separate from the wild-type samples (**Supplementary Figure S7**).

Supplementary Figures

Supplementary Figure S1. Schematic of variant filtration. Variants present in a targeted gene list were retained based on CADD phred-like scores and minor population allele frequency. Variants in cases without matched germline were filtered based on mutation type or presence in a recurrently mutated gene, ClinVar or COSMIC databases.

Supplementary Figure S2. RAS/MAPK pathway mutations. Mutations identified within RAS/MAPK pathway genes are shown within involved protein domains.

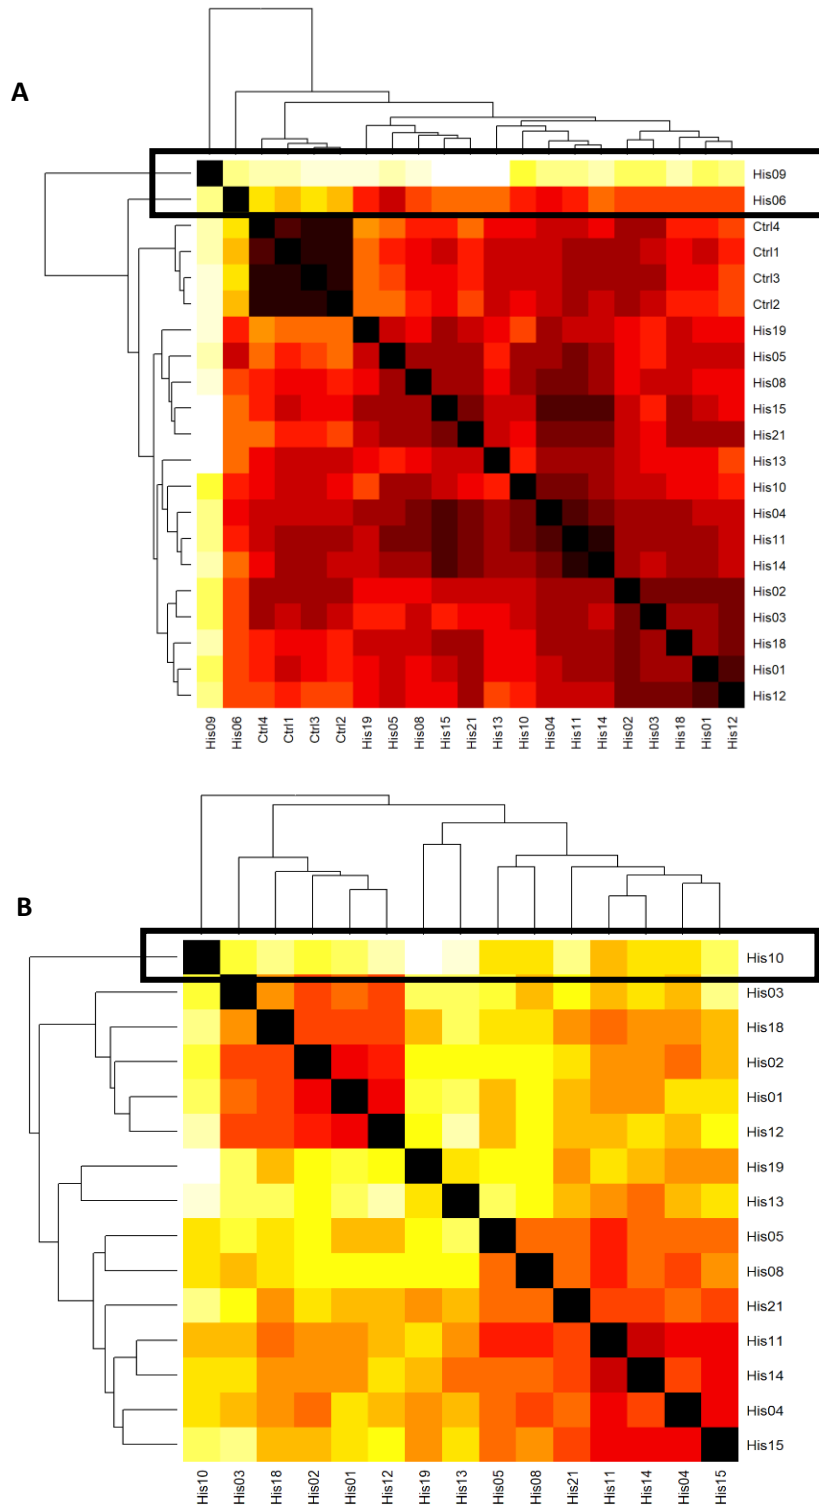

Supplementary Figure S3. Copy number losses. (A-C) *NF1/PTPN11* altered case from the GI tract; (A) H&E stain, original magnification x400, with losses of 10q and 17p confirmed by FISH (B) CEP 10 (green), *PTEN* (orange). (C) CEP 17 (green), 17p13.1 (orange). (D-E) *NF1/PTPN11* wild-type case; (D) H&E stain, original magnification x400 with homozygous deletion of *CDKN2A* confirmed by FISH (E); CEP 9 (aqua), 9p21 (orange).

Supplementary Figure S4. Exploratory analysis of RNA-Seq data. Unsupervised clustering based on transcriptome-wide gene expression and using Euclidean distance with complete linkage. **(A)** Two samples (indicated by rectangle) were outliers to both tumor and normal groups and were excluded. **(B)** One sample (indicated by rectangle) clustered separately to the remaining samples in the tumor cohort and was excluded from the comparison of the intratumoral subgroups.

Supplementary Figure S5. Assessment of GI site and cell cycle clustering. Heatmap of log transformed normalized counts of the 2205 differentially expressed genes between tumor and normal samples (absolute log FC of > 1 and FDR of < 0.05). There is separation of the tumor samples into the subgroups identified during exploratory analysis.

Supplementary Figure S6. Assessment of GI site and cell cycle clustering. Heatmap of log transformed normalized counts of differentially expressed genes between tumor and normal samples (absolute log FC of > 1 and FDR of < 0.05) following removal of GI site-related genes. The clustering is unchanged. The 'Red Box' highlights the genes that appear most differentially expressed between tumor subgroups (listed in **Supplementary Table S7**).

Supplementary Figure S7. Assessment of GI site and cell cycle clustering. Heatmap of log transformed normalized counts of differentially expressed genes between tumor and normal samples (absolute log FC of > 1 and FDR of < 0.05) following removal of the cell cycle-related ('Red Box') genes. There is re-organization of the heatmap with the tumor subgroups no longer clustering.
