Version 3

Early high plasma ST2, the decoy IL-33 receptor, in children undergoing hematopoietic cell transplantation is associated with the development of post-transplant diabetes mellitus

Courtney M Rowan, Alicia M Teagarden, Daniel T Cater, Elizabeth A.S. Moser, Giorgos Bakoyannis, and Sophie Paczesny

Disclosures: S.P. has a patent on “Methods of detection of graft-versus-host disease” licensed to Viracor-IBT Laboratories. Otherwise, the authors declare that they have no competing interests. The authors report the following grant support: Dr. Teagarden (T32-HD069047), Dr. Rowan (1K12HD068371-01A1 – K12 Child Health Research Career Development Award), and Dr. Paczesny (R01-HD074587, R01-CA168814, U54-HD090215).

Contributions: All authors participated in the study design, review of the analysis and approval of the final manuscript. CR wrote the original draft that was edited and approved by all authors. AT, DC, and CR participated in data collection. EAS and GB carried out the statistical analysis that was then reviewed by all authors. SP helped to conceptualize the study, provided oversight for the data collection, ran the ELISAs for the ST2 data, and critically reviewed the analysis and manuscript.
