Title

The dynamic emergence of GATA1 complexes identified in *in vitro* ES differentiation and *in vivo* mouse fetal liver

Authors

Xiao Yu^{1,2}, Andrea Martella^{1,3}, Petros Kolovos^{1,4}, Mary Stevens¹, Ralph Stadhouders^{1,5}, Frank G. Grosveld¹ and Charlotte Andrieu-Soler^{1,6,7}.

Supplementary data

Figure and Table Legends

Figure S1. Nuclear extract fractionation and GATA1/LDB1/FOG1 immunoprecipitation during ES cell differentiation

Panel A: Western blot of a number of relevant transcription factors that are part of the GATA1/FOG1 or GATA1/LDB1 complexes. At this stage of differentiation, the expression of GATA1 is still low when compared to MEL cells or Fetal Liver (FL) cells, although it should be noted that the day 4 and 5 differentiated ES cells are a mixture of early hematopoietic cells and other cell types.

Panel B: Size fractionation experiment of nuclear extract at day 4 of ES cell differentiation. The NE from fetal liver (FL) and MEL cells are the positive controls for protein detection. The GATA1/LDB1 complex fractionates around 670 kd (fractions 24 and 25), while the GATA1/FOG1 complex fractionates around 250-300 kd (fractions 27 and 28). The fractionation was carried out on the day 4 mixture of cells when the expression of several of the TFs is still very low, e.g. LMO2 (fractions 23 and 24).

Western blot of transcription factors in GATA1, LDB1 and FOG1 IP samples in wild-type ES cell differentiation at day 4 (**Panel C**), day 5 (**Panel D**) and in Ldb1-KO at day 5 (**Panel E**). VCP was used as an internal loading control.

Figure S2. Immunofluorescence on E12.5 fetal liver tissue

Immunofluorescent staining of LDB1, GATA1 and FOG1 proteins on section of mouse fetal liver tissue on E12.5. LDB1 protein (labeled with Cy3) or FOG1 protein (labeled with Cy3) which was co-stained with GATA1 (labeled with FITC) were shown on the same slide of fetal liver tissue or on MEL cells as positive control. Secondary antibody alone functions as a negative control. All scale bars represent 20 μ m.

Figure S3. Selected gene in RNA-seq across differentiation stages in sorted fetal liver cells

The read-count of duplicates of RNA-seq data from each P1 to P4 population were averaged. Gene expression pattern of selected genes in P1 to P4 populations is shown.

Figure S4. LDB1 and GATA1 KD effects on erythropoiesis

Panel A: Western blot detection of LDB1 and GATA1 knockdown efficiency in fetal liver cells on day1 (D1) to day3 (D3) using empty vector, pLL3.7 and two independent LDB1 shRNAs and one GATA1 shRNA, respectively. VCP was used as an internal loading control.

Panel B: FACS analysis of LDB1-KD or GATA1-KD in fetal liver cells at day3 based on TER119 and CD71. The four populations are described in **Figure 3A**. “Relative ratio versus control” in each population is shown, referring to the cell numbers normalized to the control shRNA in each population. For LDB1-KD, the analysis is separated by two types of cells, “GFP⁺ cells” or “All cells”, while only “All cells” is shown for GATA1-KD. Error bars present standard error of the mean (sem) from three biological replicates.

Table S1. RT-qPCR primers

RT-qPCR primers for mouse genes used in this study are listed.

Table S2. Antibodies used in WB, immunofluorescence and PLA

Antibodies used in this study for Western blot (WB), immunofluorescence and PLA.

Table S3. Differentially expressed gene list in each comparison

Significant up- or down-regulated differentially expressed genes (in **Figure 3D**, Log₂ fold-change >0.6 or <-0.6 and p-val<0.01), are listed in each comparison of P1 vs P2, P2 vs P3, and P3 vs P4.

Figure S1. Nuclear extract fractionation and GATA1/LDB1/FOG1 immunoprecipitation during ES cell differentiation
