## **Supplementary Methods**

### **Immunophenotyping and cytomorphologic analysis**

Fresh peripheral blood and BM or cryopreserved PBMC of T-PLL patients and healthy donors were stained using the 8-color EuroFlow T cell Chronic Lympho-Proliferative Disease (T-CLPD) panel (1). Acquisition was performed on a FACSCanto II flowcytometer (BD Biosciences) and the data was analyzed with Infinicyt software (Cytognos), as previously described (1). All six files were merged. Using the backbone markers, T-PLL cells were discriminated from normal T cells. Calculations were performed on T-PLL cells only. The T-PLL phenotype was compared to the phenotype of 6 normal T cell developmental stages (CD4+ and CD8+ naïve, memory and effector T cells) from healthy individuals and visualized as multidimensional principal component plots (so-called Automated Population Separator (APS) views). TGF $\beta$ R1, TGF $\beta$ R2 and TGF $\beta$ R3 expression on human PBMCs and T-PLL cells was evaluated using ab235178 (Abcam) and PE-conjugated Goat F(ab')2 anti-rabbit (4052-09, Southern Biotech), APC-conjugated FAB241A-100 (R&D Systems) and PE-conjugated FAB242P (R&D Systems) antibodies, respectively. For morphological analysis, blood smears were stained with May-Grünwald-Giemsa as described (2).

### **Fluorescence *in situ* hybridization analysis and cytogenetics**

DNA fluorescence *in situ* hybridization was performed according to the manufacturer's instructions on fresh or thawed mononuclear cells using probes specific for 11q22/ATM, 17p13.1/TP53 or 14q32 (Vysis LSI p53 / LSI ATM / TCL1, Abbott Laboratories). For karyotyping, bone marrow or peripheral blood specimens were examined for chromosomal abnormalities using standard G- or R-banding techniques. Results were described according to ISCN 2013 guidelines.

### **T cell receptor gene rearrangement analysis**

Genomic DNA (Sigma GenElute Mammalian DNA kit) and/or total RNA was isolated (total RNA kit, Sigma) from PBMC fractions of T-PLL samples. Identification of *TRB* gene rearrangements and complementarity determining region 3 (*CDR3*) regions was performed on genomic DNA according to the multiplex BIOMED-2 protocol (InVivoScribe (3)) followed by Sanger sequencing (ABI 3100 Genetic Analyzer) and analyzed using CLC Main Workbench (Qiagen). The acquired nucleotide sequences were aligned to a current database (IMGT/V-Quest) to assign TRBV, TRBD, and TRBJ genes and reading frames of the gene rearrangements. cDNA synthesis was performed using 10x CA buffer (0.2 M Tris pH8.3, 0.5M KCl), 25 mM MgCl<sub>2</sub> (Applied Biosystems Life Technologies), 100 mM dithiotreitol (Invitrogen Life Technologies), 100 μM random primers (Invitrogen), 10 U/μL recombinant RNAsin (Promega), 200 U/μL reverse transcriptase Superscript II (Invitrogen Life Technologies) and 20mM dNTP (GE Healthcare). cDNA was then amplified using a constant region reverse Cα primer and 54 different Vα family-specific forward primers, divided over five different multiplex tubes as previously described (4). The acquired nucleotide sequences were aligned to the IMGT/V-Quest database to assign TRAV and TRAJ genes and reading frames of the gene rearrangements. Circoletto software (<http://circos.ca>) was used to analyze the data and to identify any skewing of the TCR rearrangements within the T-PLL patient cohort.

### **Lentiviral miRNA expression vectors and transduction of Jurkat and HeLa cells**

The MIR200C/141 cluster was first amplified with primers miR-200c/141\_FW4: 5'-CCGTGGAATCTGGGGCCTTAAAGC-3' and miR-200c/141\_RV3: 5'-TCTTCCTCATGTTCCCCTTC-3'. Next, a nested PCR was performed with primers miR-200c/141\_FW2: 5'-TGGGTAAATCGGTGTGTGTC-3' and miR-200c/141\_RV2: 5'-

CGGGAAGACAATGGAGGTG-3'. To link the SV40 promoter to the miR-200c/141 sequence, a 30 nucleotide overhang was generated, using pBSV40-miR-200C/141\_FW: 5'-GGCTTTGCAAAAAGCTTACCATGACCGAGTGGTAAATCGGTGTGTC-3' and miR-200c/141\_RV2. Adding AgeI and NheI restriction sites to the insert was done with primers MSCV-SV40-NheI-FW: 5'-GCTAGCTGTGGAATGTGTGTCAGTTAG-3' and miR-200c/141\_AgeI\_RV2: 5'-ACCGGTACAACAGTAGGAAGGTGAG-3'. The fragment was cloned in pJET1.2/blunt and analyzed by Sanger sequencing. This vector was digested with NheI-HF and AgeI-HF (NEB) and the insert was gel purified and ligated into the NheI-AgeI sites of pLX301 (Addgene plasmid #25895) (5), resulting in pLX301-miR-200c/141. Lentiviral particles were generated as described (5). Jurkat cells were plated in a 24-well plate in RPMI, FCS (10%), P/S and HeLa cells were plated in 6-wells plates in DMEM supplemented with FCS (10%) and P/S. The pLX301 viruses were added to the medium with Polybrene (8 µg/mL) (Sigma-Aldrich, Cat #H9268). Cells were spun at 800xg for 2 hours at 37 °C. Transduced cells were selected on Puromycin (1 µg/mL).

### **Gene expression profiling**

Gene expression analysis was performed on peripheral blood/bone marrow mononuclear cells of 23 T-PLL cases and 6 normal T-cell subsets (naïve, memory and effector of CD4+ and CD8+ cells) of 3 healthy donors. When the tumor load of a patient was below 85%, cells were purified using cell sorting on a FACS Aria III (BD Biosciences) based on the CD4 and CD8 expression on T-PLL cells. RNA was isolated from mononuclear cells using the Qiagen RNeasy mini kit and RNA integrity was checked according to the Agilent RNA 6000 Nano Assay Protocol. RNA was reverse transcribed into cDNA, purified, fragmented and biotinylated as described previously (6). All cDNA was hybridized to Affymetrix HG-U133 Plus 2.0 GeneChip arrays (containing 54,675 probe sets) according to the Affymetrix GeneChip 3' IVT Express Kit user

manual (Affymetrix). Quality of the data was checked with the R package “affyQCReport”. In short, probe intensity background was removed using robust multichip analysis (7). The intensity levels were quantile normalized (8). Array groups (two biologically independent arrays per group) that corresponded to the development stages were compared based on the perfect match probe intensity levels only (7), by performing a per-probe set two-way analysis of variance (ANOVA, with factors “probe” and “stage”)(9). The p-values were adjusted for multiple testing using Šidák step-down adjustment (<https://statistics.berkeley.edu/tech-reports/633>) and all differences with adjusted p-values <0.05 were considered to be significant.

## **RNA sequencing**

T-PLL cells were lysed in TRIzol (Invitrogen) and total RNA was isolated according to manufacturer’s protocol. Quality and concentration of total RNA of the samples was determined with the RNA 6000 Nano assay on an Aligent 2100 Bioanalyzer (Agilent Technologies). Only samples with RNA integrity number (RIN) > 7 were used for analyses. The small non-coding RNA cDNA libraries were generated with 100 ng total RNA using CleanTag Small RNA Library Preparation Kit (Trilink Biotechnologies) according to the manufacturer’s protocol. For genome wide gene expression profiling, cDNA libraries were generated with 1 ng total RNA using the Smart-Seq V4 Ultra low input RNA kit (Takara-bio) in combination with the Truseq nano DNA library prep kit (Illumina). Quality and concentration of cDNA libraries were determined with the Agilent High Sensitivity DNA Kit on an Agilent 2100 Bioanalyzer. All cDNA libraries were run on the Illumina HiSeq2500 or Illumina MiSeq sequencing platform according to manufacturer’s protocols.

## **mRNA and miRNAs data analyses**

After sequencing and de-multiplexing the quality of the data was assessed with fastQC (v 0.11.8). When the RNA sequence data passed the quality check, fastq files were aligned using STAR aligner (v.2.5.3e) with GRCh38 as reference. The small non-coding RNA reads were trimmed and aligned with Novalign, using novoalign indexes. Read counts were obtained using FeatureCounts (v1.6.0) and Homo\_sapiens GRCh38.92 as reference for the RNA sequencing data and miRBase.annotation20 for miRNA sequence data. The quality of the alignment and assigned reads were determined with MultiQC. Noise reduction was applied to the count data by removing the very low read counts (RNA sequence data) and increasing the miRNA counts by 50. The rlog transformation from the DEseq2 R package (v1.22.2) was used for data processing, clustering, heatmap and PCA plots. This command transforms the raw count data to the log<sub>2</sub> scale in a way which minimizes differences between samples for rows with small counts, and which normalizes with respect to library size (10). DESeq2 was used for normalization of the data (median of ratios) and to determine differentially expressed genes (10, 11). Differentially expressed genes were statistically analyzed by the Wald test with Benjamin-Hochberg's correction for multiple testing. For miRNA target analyses we extracted lists of predicted targets from TargetScan ([www.targetscan.org](http://www.targetscan.org)) (Supplementary Table 2-4). The significantly differentiated genes were used for enrichment analyses (GSEA, GSEA Desktop Application (v2.2.1). Kaplan-Meier plots were generated using IBM SPSS Statistics version 25 and the statistical difference in survival was calculated using the Mantel-Cox Log Rank test. A multiple regression analysis was run to determine confounding factors for survival, including age, gender, white blood cell count and immunophenotype.

### **Quantitative PCR of miRNAs and mRNAs**

Single small RNA qPCRs for U6, miR-141-3p, miR-200c-3p, miR-181a-5p and miR-181b-5p were performed with Taqman single real-time assays with kit ID 001973, ID 000463, ID 002300, ID 000480, ID 001098 (Applied Biosystems) respectively, according to the manufacturer's protocol. For total cDNA preparation, the High-Capacity reverse transcription kit (Thermo Fisher Scientific) was used. GAPDH, ZEB2, TGF $\beta$ 1, TGF $\beta$ R3 mRNA was determined with Taqman gene expression assays Hs02786624\_g1, Hs00207691\_m1, Hs00998133\_m1 and Hs00234257\_m1 (Thermo Fisher Scientific) respectively, according to manufacturer's protocol. Relative expression was calculated with the  $\Delta\Delta Ct$  calculation method using GAPDH as loading control.

### **Western blotting**

HeLa cells transduced with either EV or miR200c/141, or T-PLL and PBMC samples were incubated in complete medium either in the presence or absence of 10 ng/mL huTGF- $\beta$ 1 (Peprotech) for 1h at 37°C. After incubation, cells were cooled on ice and washed three times in phosphate-buffered saline (PBS). Cells were lysed in NP-40 lysis buffer supplemented with phosphatase and protease inhibitors on ice. Protein-extract concentrations were measured using BCA protein assay kit according to manufactures protocols (Thermo Scientific). Equal amount of protein was loaded on Mini-Protean TGX precast gels (Bio-Rad). Blots were labeled with either anti-phospho-(Ser465/467)-SMAD2 (138D4, Cell Signaling, dilution 1:1000), anti-SMAD2/3 (D7G7, Cell Signaling, dilution 1:1000), anti-phospho-(Ser423/Ser425)-SMAD3 (ab52903, Abcam, dilution 1:1000), anti-TGF $\beta$ RI (ab235178, Abcam, dilution 1:2000), and anti- $\beta$ -actin (Sigma, dilution 1:3000) at 4°C overnight. Next, the membranes were incubated with IRDye 680RD Goat anti-Rabbit IgG Secondary Antibody (Li-COR, dilution range 1:5000

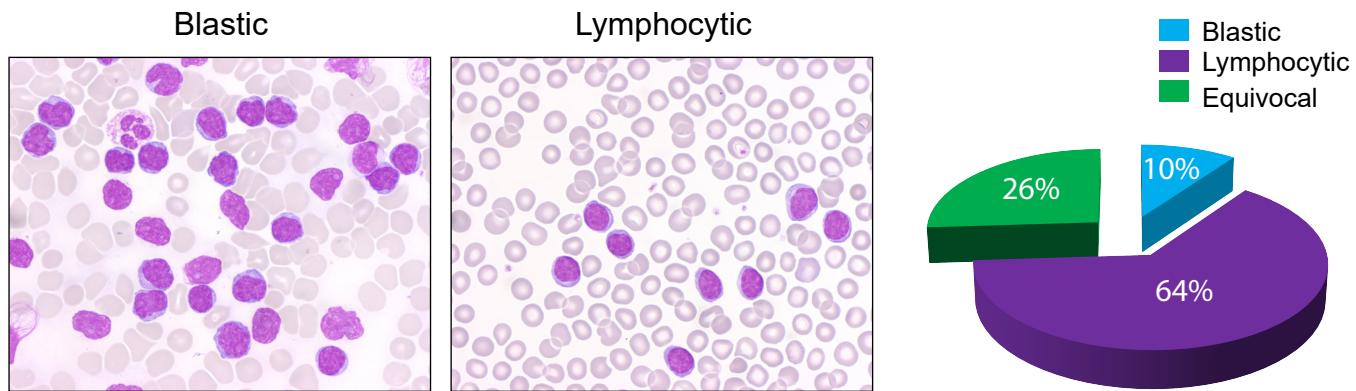

– 1:10000) at room temperature for 1 hour. Images were taken with Odyssey Imaging System (Li-COR) and analyzed using ImageStudio Lite.

## Morphological and immuno-phenotypic characterization of T-PLL

**A)** Blood smears showing examples of blast-like and lymphocytic morphology of T-PLL cases. Pie chart shows the percentages of the different morphologies in our T-PLL cohort. **B)** Multidimensional APS analysis (Automated Population Separation; Infinicyt software) of T-PLL cases, based on all parameters of all tumor cells of each T-PLL case, resulting in clustering of most T-PLL cases, except for two outliers (T-PLL 10 and 24). Graphs highlight the markers in descending order and their relative contribution to separation in the first and second principal component (PC). **C)** APS plots of six different CD4+ or CD8+ normal T cell subsets were generated and then fixed. Contours lines represents 2x standard deviation (2 s.d.). Next, T-PLL cases were added to the APS analysis to evaluate their relatedness to normal T cell subsets. The majority of T-PLL cases appeared to cluster closer to the CD4+ and CD8+ memory T cell subsets above the dashed line, whereas some cases clustered more with the non-memory subsets. **D, E)** Circoletto plots showing diversity of V and J gene usage of TRA and TRB gene rearrangements in T-PLL samples.
